Difference engines are so called because of the mathematical principle on which they are based, namely, the method of finite differences. The beauty of the method is that it uses only arithmetical addition and removes the need for multiplication and division which are more difficult to implement mechanically. Difference engines are strictly calculators. They crunch numbers the only way they know how - by repeated addition according to the method of finite differences.

Gas vs. Diesel Engines. One of the most important differences between gas and diesel engines is the thermal efficiency of diesel engines, or the work that can be expected to be produced by the fuel put into the engine. A diesel engine is about 20% more thermal efficient than a gas engine. This directly relates to a 20% increase in fuel economy.
